

Massage arm

Abstract

5 A message arm (1), comprising a message element (2) for a message
unit that can be incorporated into a message chair or similar, is
hinged on at least one shaft that can be moved by a drive in the
message unit, and has an articulated connection to the message
element (2). To achieve an improved massaging action with the
10 message arm and the attached message elements, it is proposed
that the articulated connection comprise a ball-and-socket joint
(3). (Figure 1)
